Disclosures: Infectious Diseases Specialist, BCCDC

Dr. Mel Krajden

Disclosures: BCCDC Public Health Laboratory, research contracts/grants from: Roche, Siemens, Hologic

Dr. Bonnie Henry

Disclosures: Provincial Health Officer

Epidemiology and Modeling COVID-19 Epidemic in BC

May 26, 2020

David M. Patrick, MD, FRCPC, MHSc

The number of reported cases remains low. Recent increases have been related to outbreaks. The majority of cases are related to local acquisition through a known case or cluster.

Figure 4: Likely source of infection for COVID-19 cases in BC by episode date[§], January 15 - May 20, 2020 (N=2,478)

[§] Episode date is based on symptom onset date (n=2,305), if not available then date COVID-19 was reported to health authority (n=160).

* March 16: Entry of foreign nationals banned; symptomatic individuals banned from flights to Canada; international flights restricted to four national airports.

** March 20: US/Canada border closed to non-essential travel.

The number of cases in hospital and critical care continues to decrease.

Figure 9: Total positive COVID-19 cases in critical care by day, BC, March 25 - May 21, 2020

Data source: PHSA May 21. Note: critical care data may change over time due to small adjustments and improvements in data quality.

Biological sex distribution among cases is equal, however males have a higher proportion of hospitalization, ICU admission and deaths.

Figure x: Percentage distribution of COVID-19 cases, hospitalization, ICU admissions and deaths by sex compared to the general population† of BC, January 1 – May 20, 2020 (N=2,460*)

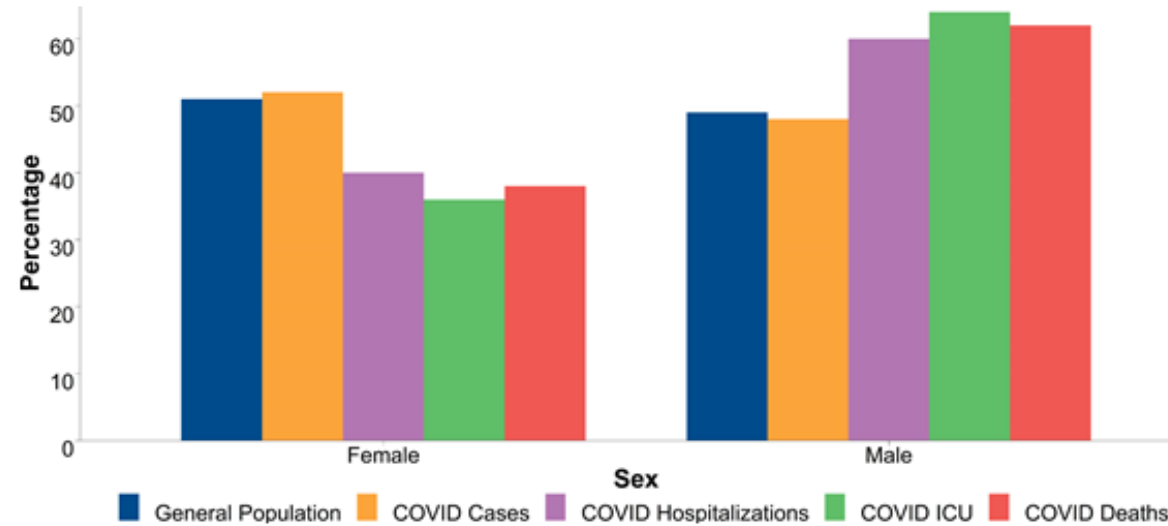

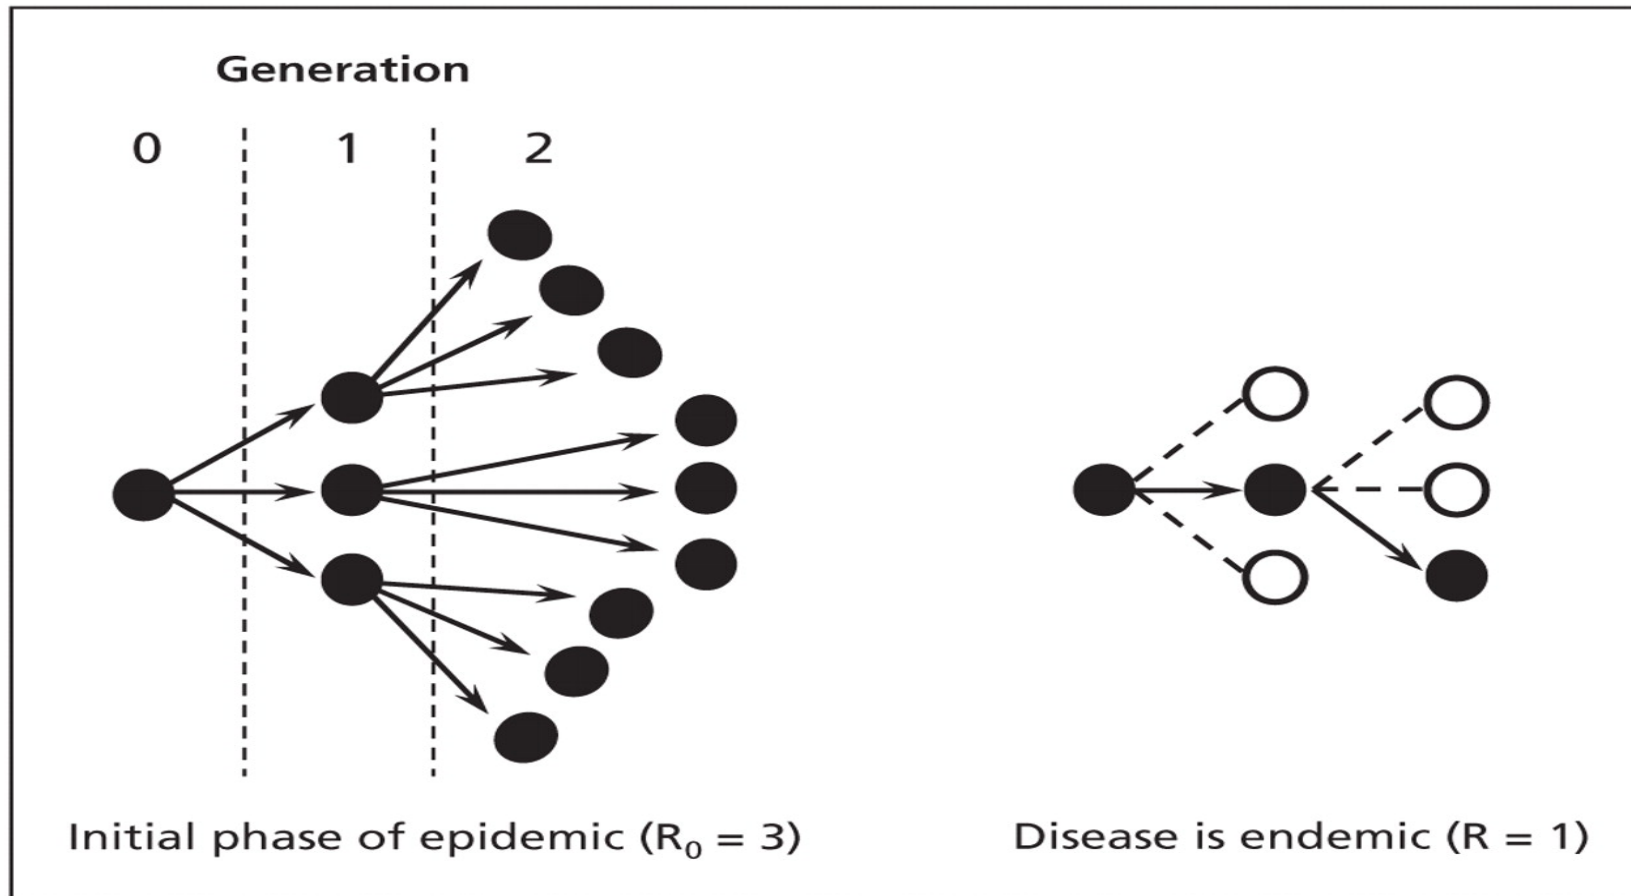

Table x: Number and percentage distribution of COVID-19 cases, hospitalization, ICU admissions and deaths by sex, compared to the general population of BC, January 1 – May 20, 2020 (N=2,460*)

Sex groups	COVID cases n (%)	Cases ever hospitalized n (%)	Cases ever in ICU n (%)	COVID deaths n (%)	General population† n (%)
Female	1,287 (52)	193 (40)	63 (36)	57 (38)	2,584,486 (51)
Male	1,173 (48)	293 (60)	110 (64)	92 (62)	2,526,037(49)
Total	2,460	486	173	149	5,110,523

*7 cases had unknown sex

† PEOPLE2019-2020 population estimates

$R_0 \sim (\text{Contact Rate}) \times (\text{Transmission Risk Per Contact})$

Estimated contact rate is at 38% of normal, suggesting strong physical distancing has largely been maintained

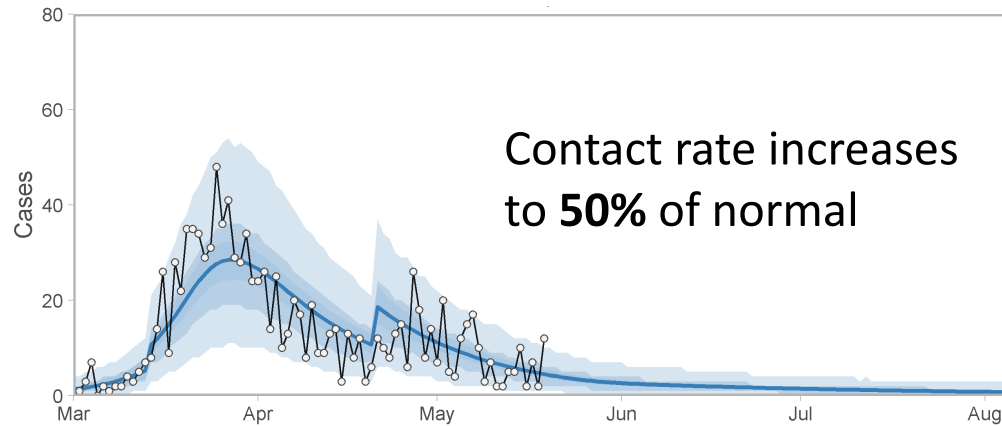

The model estimates that the rate of close contacts (that could lead to transmission) has declined to 38% of normal (95% credible interval: 34% - 43%).

Solid blue line: mean; shaded bands: 50% and 90% credible intervals; Open circles: reported cases
Cases used for model fitting exclude those attributed to outbreak clusters

As relaxation of distancing occurs, too much may result in a rapid rebound in transmission

Where just above threshold, reducing transmission risk per contact will be important.

Contact Tracing: Completeness Must Remain High

New cases per day

Minimum ~25% contact tracing needed to prevent growth

Minimum ~50% contact tracing needed to prevent growth

Minimum ~75% contact tracing needed to prevent growth

*Assuming $R_0=2.05$, importation=1, and 1-2 days to trace contacts

If transmission from children is lower than that from adults, risk of rebound associated with school opening is smaller

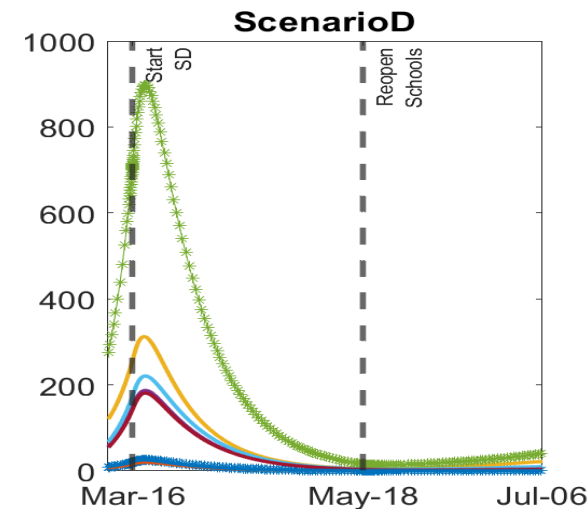

Susceptibility = 5%

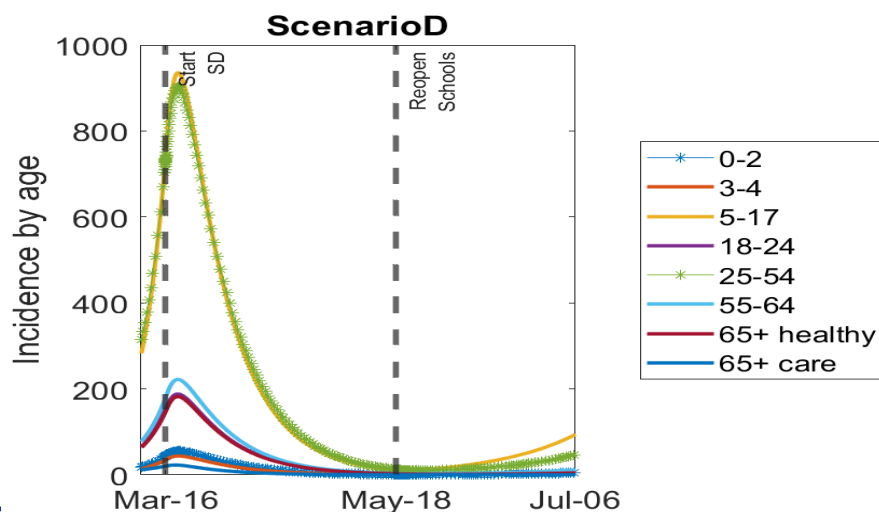

Susceptibility = 20%

Susceptibility = 50%

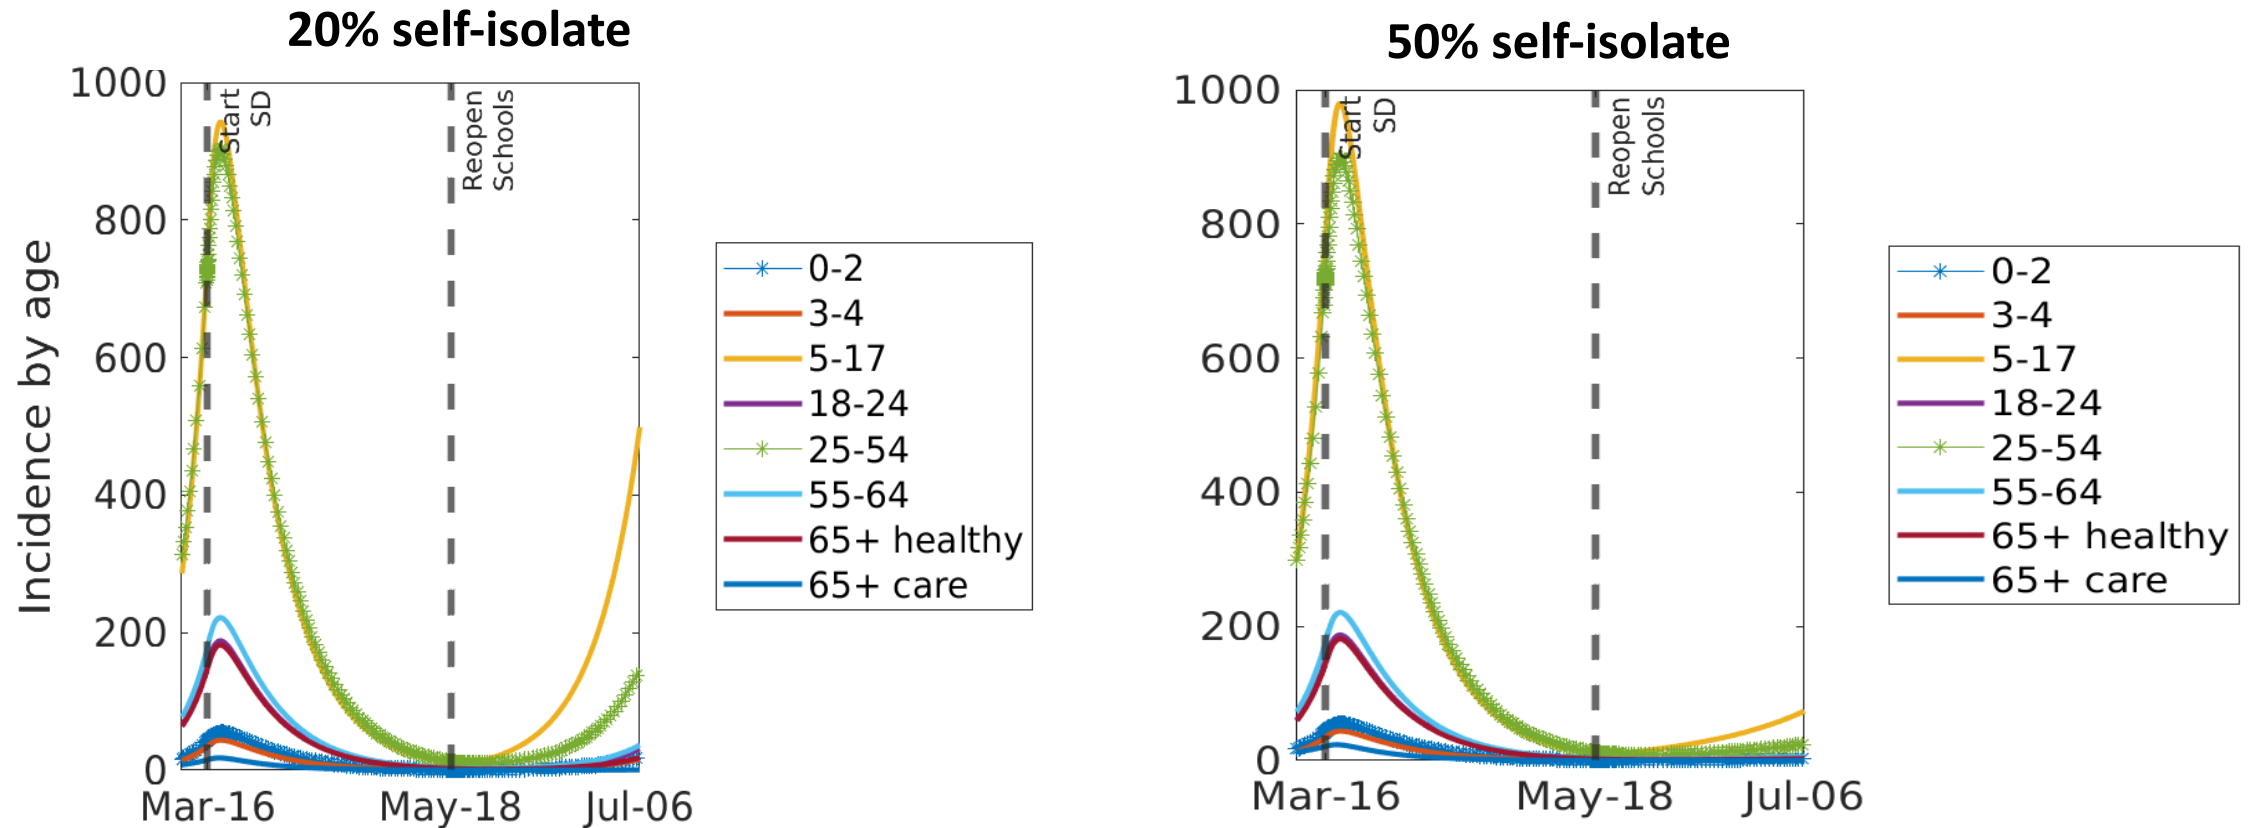

Susceptibility = 100%

Greater susceptibility among children results in more rapid transmission with schools reopened, but mostly within this age group

Importance of Self-Isolation

- Self-isolation by symptomatic individuals greatly reduces transmission in these school opening scenarios

Key Messages

1. The number of reported cases and hospitalizations remain low.
2. The majority of cases are related to local acquisition through a known case or cluster.
3. Sex distribution among cases is equal, however males have a higher proportion of hospitalization, ICU admission and deaths.
4. **To keep R_0 below 1 we must:**
 - **Avoid increasing contact rates too much**
 - **Stay home when sick**
 - **Embrace measures to reduce transmission when contact cannot be avoided**
 - **Assure that testing and contact tracing perform well (Push for 95% Completeness)**
5. We need to learn more about childhood susceptibility. If transmission from children is truly lower than that from adults, risks associated with school opening are smaller
